RxCheck

RxCheck SRS HCE 3.1 Build#82 Patch Release
August 16, 2024

This patch release addresses the NCPDP 2017071 mapping issues reported by some healthcare entities. In certain cases, messages were not returned to the EHR system. The problem occurred when the translator encountered issues mapping the NIEM4 message to NCPDP. These issues have now been resolved in this release.

Patch download location:

http://builds.rxcheck.org/SRS/v3.1/public_final/hce/patches/

Assumptions:

This patch assumes you already have an SRS v3.1 running on your servers. HCEs and vendors will require no development changes.

Steps to apply the patch:

1. Download new *rxoutbound.war* and *default.properties* files from the patch location.
2. Shutdown current RxCheck SRS v3.1 process.
3. Take a backup of all the files and folders under the *webapps* folder of the SRS installation.
4. Delete all files and folders under *webapps* folder of the SRS installation.
5. Copy the new *rxoutbound.war* file to the *webapps* folder.
6. Copy the new *default.properties* to the *conf* folder*.
7. Start the RxCheck SRS v3.1 process.

IT/Vendor Questions:

If your IT/vendor personnel would like to discuss this patch release or have technical questions, please have them email Phil Winiarski at IJIS at phil.winiarski@ijis.org, to schedule a call with the RxCheck technical team.
